

# Save the Humanity with Amalgamation of Social and Technical Sciences: Multi - Facet Status of Social Sciences

Dr. I. Annapurna

Associate Prof, P.G. Dept of Economics, Ch. S. D. St. Theresa's College for Women,  
Eluru, West Godavari Dist. Andhra Pradesh, 534003, India.

---

**Abstract:** Right from the days of British India the Europeans always manufacturing only the working class in India and elsewhere colonies of Europeans the working class means it may be blue or white collar. They are making the colonial population as working class with cheaper wages to the needs of their mass production systems. Recently they are employing lakhs of people from India & other developing countries in the sectors of "Information technology and Bio-technology". Because of economic problems & unemployment the people of developing & under developing Countries are running after these jobs. Here we observe there is no human element moral bindings and sensitive aspect of relation. But there is only materialistic life in the western way of education.

Though the education system in ancient India the scientific development was more advanced than today's Western science and technology For Ex - The Brahmastra mentioned in Ramayana and Mahabharatha was more tactical polarized effective high-tech like ultimate weapon. Use of such weapons has been supported by the observations based data collected by NASA satellite ATS-6\*.

Ancient Indians always maintained the moral standards to build & maintain a harmonious human society with very sensitive & tender relations between persons. The teacher & disciple, Parents & the children & the elders & youngsters and always wished the universal peace & development without hurting single living organism. The discipline they cultivated has given the right to live to every creature on this earth. Still there are no perfect tactical nuclear or laser weapon with polarisable, energy emission system. There are number of such examples when we go through our ancient Indian scientific history, not the history published and edited by Macleay. By modern management policies it became the principle mandate, that squeezing of everybody's physical & psychological energies. Liberalization refers to a relaxation of government restrictions in areas of social and economic policy. With economic reforms India is set to enter a world of competition. India has huge human resources with high earning potential.

**Key words:** polarized, harmonious, universal peace, squeezing, psychological energies, Liberalization, economic reforms, earning potential.

## Introduction

To achieve highest immoral luxuries of some unscrupulous inhuman tycoons, In modern sense, scientific development means exploitation of all the resources the biological & physical of this earth polluting the earth in to a uninhabitable place for all living organisms.. Because today's student tomorrows researcher or administrator is building his education without the human touch and humanitarian moralities and the history of bad and good. That is why the modern citizen becoming a mechanical machine just taking in energy resources & letting, out toxic waste. So, here in our search on higher education we found that because the short vision of the political administrations, economic managers & public administrators have lost the balance and future vision of peaceful development of the future societies by eliminating or discouraging the social sciences from the curricula by discriminating with salaries in comparison with technological sciences. To stabilize the deteriorating moral standards in all walks of life, the political administration should at least now reform the education system, so that social sciences should be made compulsory along with tech-sciences through course curriculum formulation.

Our specific need and necessity to the future of the nation is to develop the social sciences and conventional courses. The science & technology can be compared to chariot but charioteer is social sciences. The development of any nation lies with science and technology, but without planning, better administration, better knowledge of history, the estimation of future economic goals cannot be possible. The social scientist with human element can only rectify this problem.

The ancient scientific development was developed along with individual morality, perfect social order for peaceful and tolerant universal coexistence. Any development should not be encouraged which deviates or degrades human element and morale of society. Today the total

development depends upon the digital signal propagation, where the digit means binary system i.e 0 & 1. It is well known fact the zero is invented only by ancient mathematicians the atom first referred by ancient Indian scientist Kanada. Already we are experiencing the anarchy and disorder in the management of private and public administrations, terrorism, social unrest, commercial and political misbehaviour growing at large because the present higher education ignoring the significance of human sciences.

Public Administration is one of the integral parts of the Political Science or even we can say the most important of all the other sciences that is Physical Sciences or Biological Sciences. Because holding the people together towards "Peace & Prosperity" is the fundamental principle of Public Administration. From thousands of years after much research & practical implementation or application, still the world has not able to bring an exemplary political administrative system, Because the creative science has to deal with the psychology of crores of people & their existence in day today life. That is why the science needs still lot of research by intellectual brains. We cannot tap such intellectual brains from fewer persons. So, there is always a need of too many students to study Political Science to innovate & design the best possible administrative system to every contemporary society.

The psychology and needs of the society changes from time to time, so to maintain the dynamic nature of the politics the students must study this science keeping the needs of the future administrations of the society to become best "Administrators & Politicians" of the world. Today, we are visualizing a global state. This needs more broadminded and intellectual brains with modern political thought. If we forget the need of this science we are going to face a chaotic society in future that will hamper all our progress of all other sciences. Ultimately the human life will get totally disturbed.

Whatever the profession you take the basic need of the society is to meet both ends that are income & expenditure. This small sentence needs lot of planning, production and distribution-management of these three is Economics. One can't imagine the society without the expertise & experts of this science. A scientist of physical sciences or computer sciences or biological sciences may think that they can make decisions instantaneously on any economic issue. But, already the world is facing flap economy planned by these scientific pseudo economists. US had proved that computer intelligence cannot handle economic parameters & economic principles - the economics or the lively

hood of the people can be managed only by economic scientists not by other scientists.

After the disastrous recession of this century if the people don't understand and keep at pace with the needs of the world economic planning & performance & educate them through economic science. The peaceful & progressive economic system developed by our predecessors will totally collapse if we neglect economic science; the entire world population has to face the most "tragic economic crisis and poverty."

The history is the conglomeration of all the deeds and knowledge of past and the shadow of the present. Whatever the subject you study we ought to know the basic history i.e the history if the innovators & details of their inventions. Then only we can make progress. For example while you are learning the atomic science you cannot understand the present developments without the knowledge of the contributions (history) of the former scientists of the subject & methods of their developments. One can only build on the strong basements of the founders of relevant sciences. This fact is true to all the subjects including sciences, mathematics and all the humanities.

Practically, whatever the text book you open first you find the history of gurus of subjects, the methods and methodologies of their development. One cannot escape from this context and situation, while learning any subject such as anthropology, sociology, philosophy, or psychology.

It is a known fact that human being cannot avoid the learning of Humanities. The modern society thinking simply that there is no need of humanities for their existence or development of our society, forgetting that every subject originates from glorious past. History also the indicator of rise and fall of individuals and societies through their deeds and methods dealt with the contemporaries where the moral binding defines fate of that society. The experiences are the real stepping stones to build a harmonious future society.

**"Every discipline has got its own place and value, its own participation in the development of the society."**
